DETAILED ACTION

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Spencer et al (6,531,107) in view of Merkle (Nanotechnology vol. 11).

The Spencer et al reference teaches a nanoscale device, note entire reference. The nanoscale device is composed of long chain carbon materials of various shapes, note figures. The sole difference between the instant claims and the prior art is the diamondoid material. However, the Merkle reference teaches different diamondoid materials and that diamondoids can be used in nanoscale devices, note page 97. It would have been obvious to one of ordinary skill in the art to modify the Spencer et al

reference by the teachings of the Merkle reference to use specific diamondoid materials in order to create strong nanoscale devices.

Claims 2 to 14 and 16 to 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Spencer et al (6,531,107) in view of Merkle (Nanotechnology vol. 11).

The Spencer et al and Merkle references are relied on for the same reasons as stated, supra, and differ from the instant claims in the specific diamondoid. It would have been obvious to one of ordinary skill in the art to determine through routine experimentation the optimum, operable type of diamondoid in the Spencer et al and Merkle in order to create the desired property in the nanoscale device.
